CALDWELL

Environmental Engineers & Consultants

Discussion Topics

- Brief history of structural stormwater management
- The Low Impact Development (LID) alternative to ponds, ponds, ponds...
- LID for Hydromodification Management:
 - State of Washington
 - City of Portland, Oregon
 - Prince George's County, Maryland
- Contra Costa approach builds on the best ideas from these programs

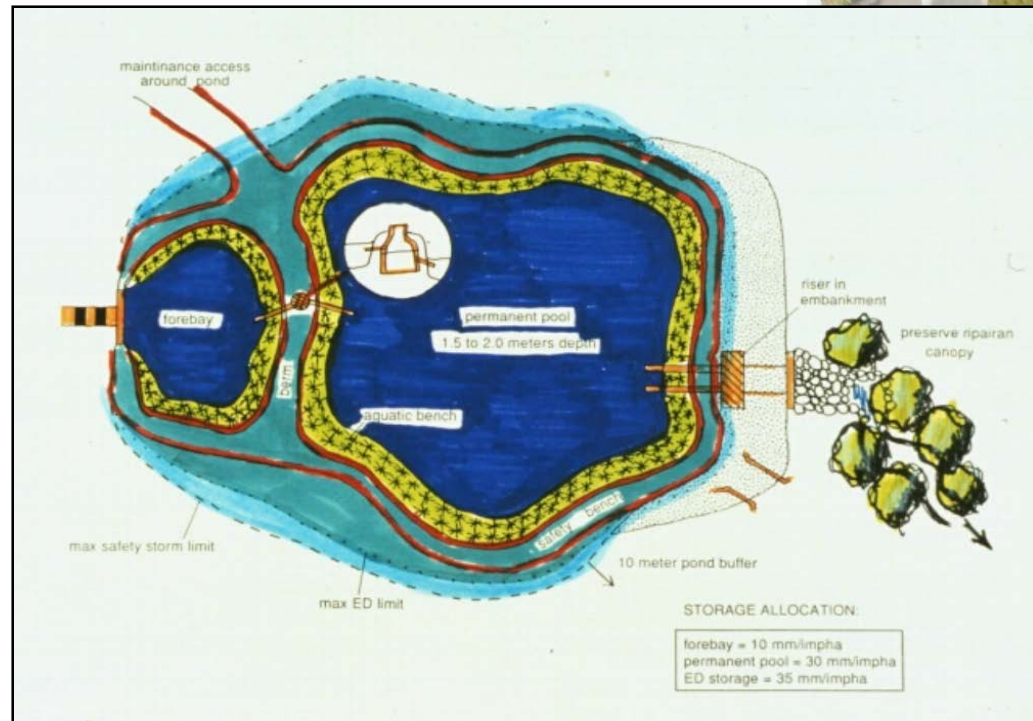

Brief History

- Pre-1990's
 - Northwest:
Detention ponds
for peak rate
control
 - California:
Emphasis on
conveyance to
regional channel
systems

Brief History (Cont'd)

- 1990's (NPDES Triggers New Thinking)
 - **Northwest:** Treatment and hydromodification added, new analytical tools, salmon also a driver
 - **California:** Structural controls appear for stormwater treatment

Brief History

- Late 1990's to Now (Convergence)
 - LID gains traction
 - Guidance Manuals proliferate! (Start at the Source 1999, Prince George's County 1999)
 - Numerous “pilot studies”
 - California: NPDES hydromod req'ts kick-in

So what do we mean by LID....

Low impact development is a stormwater management strategy that emphasizes conservation and use of existing natural site features integrated with distributed, small-scale stormwater controls to more closely mimic natural hydrologic patterns in residential, commercial, and industrial settings.

Source: (Puget Sound Action Team 2005)

Example of an LID Strategy

.12

Erosion and Sediment Control Handbook

Fig. 1.6 Effect of slope shape on erosion potential. (a) Convex slope; (b) concave slope; (c) stable slope. (Adapted from 5)

Example of an LID Strategy

Example of an LID Strategy

Why is LID so hot right now?

- Minimizes changes to natural hydrology
- Controls pollutants at the source
- Soil contact optimal for pollutant removal

Treatment Facility	TSS	Dissolved Metals incl. Cu, Zn	Total Phosphorus	Pesticides/ Fungicides	Hydro- carbons incl. O&G, PAH
Wet Pond	■	+	+		+
Wet Vault	■				
Biofiltration	■	+	+	+	+
Sand Filter	■	+	+		+
Constructed Wetland	■	■	+	■	■
Leaf Compost Filters	■	+		■	■
Infiltration ⁽²⁾	■	+		+	+
Oil/Water Separator					■
Bio-infiltration	■	■	+	■	■

Footnotes:

■ *Significant Process*

+ *Lesser Process*

Why is LID so hot right now?

- Aesthetics and public acceptance
- Vectors (e.g., mosquitoes)
- Reuse potential

So what does LID look like?...

- Site assessment
- Site planning and layout
- Vegetation protection and maintenance
- Clearing and grading
- Distributed and integrated management practices (IMPs)
- Maintenance and Education

Today's Emphasis....

- Site planning and layout – Hydrology as the “organizing principle”
 - Road, driveway and parking layouts
 - Street trees
 - Lot Layout
 - Building design
 - Collection system with...
- Distributed and integrated management practices (IMPs)

Integrated Management Practices

- Examples (Yes, people are really building these things...)
 - Highly urban environment (Growing Vine)
 - Road runoff (SEA Streets, Viewlands)
 - Parking lots (Auburn Library)
 - College campus (Olympic College)
- Spokane – LID since 1979

Growing Vine Street

Bio downspout

Bio downspout Cistern & Cascade

SEA Street Before

SEA Street After

SEA Streets

SEA-Street

ENGINEERED SOIL SWALE

SCALE: $\frac{1}{2}'' = 1'-0''$

3
19,27,33

SEA-Streets

BIORETENTION SWALE W/ SSD

SCALE: 1/2" = 1'-0"

2
27

SEA-Streets Initial Performance

- Monitoring showed 98% reduction in runoff for small storms
- Commensurate water quality benefits
- Traffic calming
- Neighborhood enhancement

Viewlands Cascade

Auburn Library

“Stacked” system: Lined bioswale overflows into underlying infiltration pipe

Olympic College

Sheet flow into swale

Lined Bioswale

Infiltration basin

Spokane Has Successfully Used Bio-Infiltration Since 1979

>8,000 Bio-infiltration facilities installed to protect Sole Source Aquifer

Lesson: Improve design standards and integrate with other codes

- Fine tune standards over time
- Address conflicts with building code

Lesson: Aesthetics increase public acceptance and success

Attractive landscape features less likely to be filled in by property owner

Lesson: Educate Contractors and Facility Owners

- Intended function and proper design

- Installation procedures
- Proper maintenance

Lesson: Inspect facilities during and after construction

- Full time staff person hired for inspections

Lesson: Provide regulatory authority to ensure long-term performance

- City ordinance requires owners to maintain swales
- Allows City to maintain facilities and charge owners

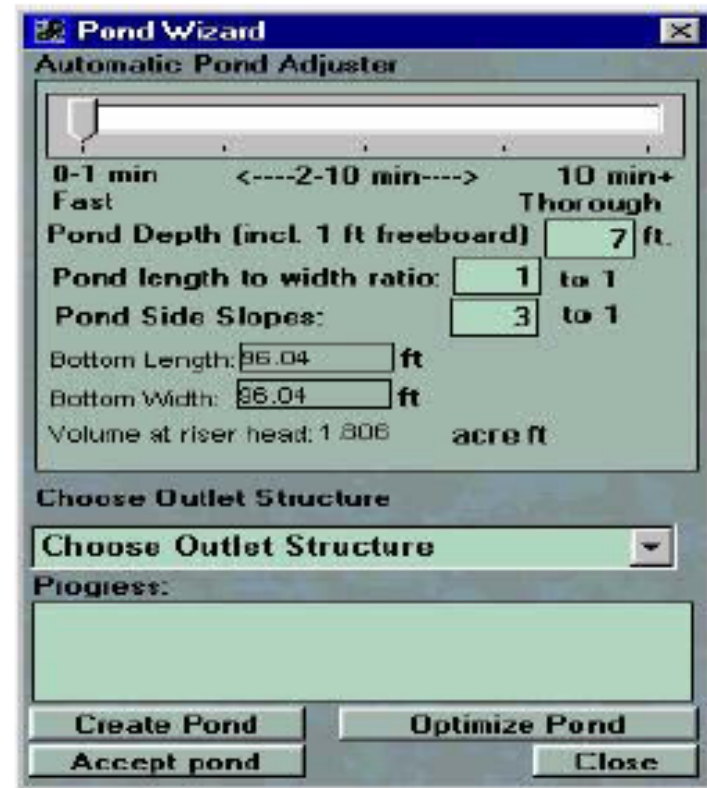

IMPs for Hydromodification Management

- Existing Stormwater Programs with emphasis on LID for Hydromod control
 - State of Washington
 - City of Portland, Oregon
 - Prince George's County, Maryland

State of Washington

- Continuous hydrology volume/duration control
- Challenge: difficult to extend modeling tool to dozens of distributed IMPs

Pond Wizard

City of Portland, Oregon

- Easy to use tool encourages LID
- Hydromod control assumed, no continuous analysis to support

Form SIM: Simplified Approach for Stormwater Management																																																								
<p>The city has produced this form to assist with a quick and simple approach to manage stormwater on-site. Facilities sized with this form are presumed to comply with pollution reduction and flow control requirements. Stormwater disposal requirements per Section 1.4 must still be met.</p>																																																								
<p>New or Redeveloped Impervious Site Area <input type="text"/> Box 1 (do not include roof areas that will be infiltrated on-site with drywells or soakage trenches)</p>		Column 1	Column 2	Column 3																																																				
<p>INSTRUCTIONS</p> <p>1. Enter square footage of new or redeveloped impervious site area in Box 1 at the top of this form.</p> <p>2. Select impervious area reduction techniques from rows 1-3 to reduce the site's resulting stormwater management requirement. Tree credit can be calculated using the tree credit worksheet on the next page.</p> <p>3. Select desired stormwater management facilities from rows 4-10. In Column 1, enter the square footage of impervious area that will flow into each facility type.</p> <p>4. Multiply each impervious area from Column 1 by the corresponding sizing factor in Column 2, and enter the result in Column 3. This is the facility surface area needed to manage runoff from the impervious area.</p> <p>5. Total Column 1 (Rows 1-10) and enter the resulting "Impervious Area Managed" in Box 2.</p> <p>6. Subtract Box 2 from Box 1 and enter the result in Box 3. When this number reaches 0, stormwater pollution reduction and flow control requirements have been met. Submit this form with the application for permit.</p> <p>7. If Box 3 is greater than 0 square feet, add square footage or facilities to Column 1 and recalculate, or use additional facilities from Chapter 2.0 of the Stormwater Management Manual to manage stormwater from these remaining impervious surfaces.</p>		<table border="1"> <thead> <tr> <th>Impervious Area</th> <th>Reduction Technique</th> <th>Area Managed = Facility Surface Area</th> </tr> </thead> <tbody> <tr> <td><input type="text"/></td> <td>1) Eco-Roof / Roof Garden</td> <td><input type="text"/> sf</td> </tr> <tr> <td><input type="text"/></td> <td>2) Contained Planter</td> <td><input type="text"/> sf</td> </tr> <tr> <td><input type="text"/></td> <td>3) Tree Credit (See Next Page)</td> <td><input type="text"/> sf</td> </tr> </tbody> </table> <p>Note: Pervious Pavement areas do not need to be included in Box 1</p> <table border="1"> <thead> <tr> <th>Stormwater Management Facility</th> <th>Impervious Area Managed</th> <th>Sizing Factor</th> <th>Facility Surface Area</th> <th>Unit</th> </tr> </thead> <tbody> <tr> <td>4) Infiltration Planter</td> <td><input type="text"/> sf</td> <td>x 0.06 =</td> <td><input type="text"/></td> <td>sf</td> </tr> <tr> <td>5) Flow-Through Planter</td> <td><input type="text"/> sf</td> <td>x 0.06 =</td> <td><input type="text"/></td> <td>sf</td> </tr> <tr> <td>6) Vegetated Swale</td> <td><input type="text"/> sf</td> <td>x 0.09 =</td> <td><input type="text"/></td> <td>sf</td> </tr> <tr> <td>7) Grassy Swale</td> <td><input type="text"/> sf</td> <td>x 0.12 =</td> <td><input type="text"/></td> <td>sf</td> </tr> <tr> <td>8) Vegetated Filter Strip</td> <td><input type="text"/> sf</td> <td>x 0.2 =</td> <td><input type="text"/></td> <td>sf</td> </tr> <tr> <td>9) Vegetated Infil. Prince George's County, Maryland

- Event based
- Cumbersome calculations steps
- No continuous, duration analyses

Low-Impact Development Hydrologic Analysis

- Site Planning
- Hydrology
- Distributed IMP Technologies
- Erosion and Sediment Control
- Public Outreach

Prepared by:

Prince George's
County, Maryland
Department of
Environmental
Resources
Programs and
Planning Division

July 1999

Contra Costa Clean Water Program

- Challenge:
 - Rapidly develop technically rigorous method and easy to use tools
- Approach:
 - Hybrid of WA/OR
 - Continuous hydrology, duration analysis
 - User friendly

The screenshot shows the 'Integrated Management Practice Calculator' software. The 'Project Information' section includes fields for Project Name (Moraga Manor Estates), Location, APN, Total Area (80500 sq ft), and Mean Annual Precip (20 in). The 'Design Goal' section has radio buttons for 'Treatment Plus Flow Control' (selected) and 'Treatment Only'. The 'Drainage Management Areas (DMAs)' tab is active, showing 'IMP1' with a 'Soil Group' of 'C' and a 'Type' of 'Flow-through Planter'. A 3D diagram of a planter box with plants and a drainage system is shown. Below the diagram are fields for 'Minimum Area (sq ft)' (605), 'Planned Area (sq ft)' (605), and 'Max Underdrain Flow (cfs)' (0.014000). A text box indicates 'IMP currently attached to the following DMAs:' with 'DMA1' listed. At the bottom, a summary table shows 'Total Area (Calculated)' for 'Drainage Management Areas' (10000 sq. ft.), 'Integrated Management Practices' (0 sq. ft.), and 'Total' (10000 sq. ft.). A red warning message states: '(WARNING: Total area of DMAs and IMPs does not equal the total project area)'. Buttons for 'Add New IMP', 'Remove Current IMP', and 'Rename Current IMP' are also visible.

Total Area (Calculated)		
Drainage Management Areas	10000	sq. ft.
Integrated Management Practices	0	sq. ft.
Total	10000	sq. ft.

(WARNING: Total area of DMAs and IMPs does not equal the total project area)
